## ABSTRACT OF THE DISCLOSURE:

A system for maintaining an IC-chip near a setpoint temperature while electrical power dissipation in
the IC-chip is varied includes a container having an open
end with a seal ring. Located in the container is at
least one nozzle for spraying liquid coolant droplets on
a portion of an IC-module which holds the IC-chip. This
spraying of the liquid coolant occurs while the seal ring
is pressed against the IC-module. Further, at least one
window is provided in the container such that it passes
energy by electromagnetic radiation from a radiation
source to the IC-module, but blocks the liquid coolant.
